

The Lane Passport 4000 Personal Communications Center

A flexible alternative to traditional email interfaces.

The Lane Passport 4000 Personal Communications Center (PCC) is a powerful client application which provides a flexible and user-friendly alternative to traditional email interfaces. Communicating directly with the Passport 4000 fax server, it can be used to prepare, send, track and receive fax messages direct from a desktop. As a result, it eliminates email latencies, storage problems and audit compliance issues.

Features include:

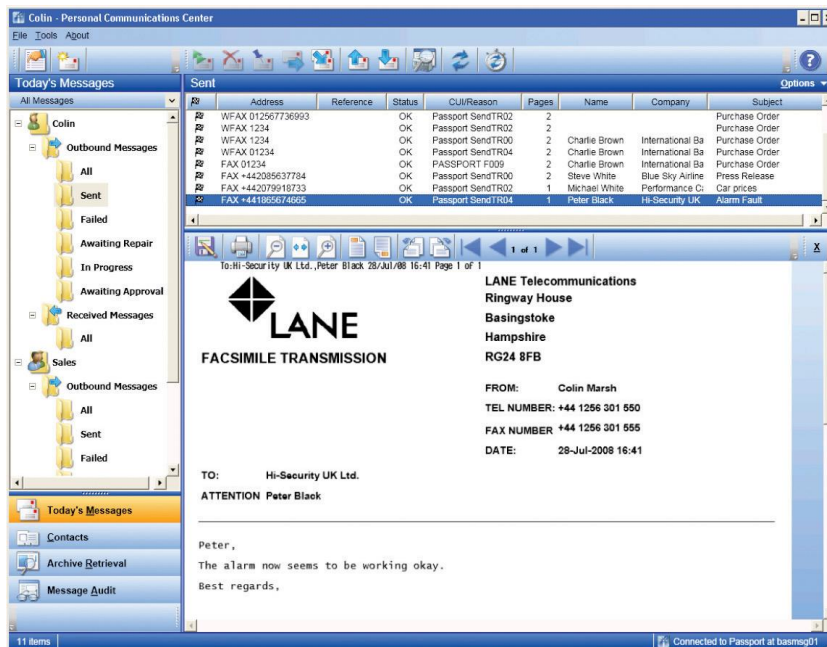

- Create messages comprising both text and attachments, and addressed to multiple destinations. Options include priority settings, delayed despatch and user-selectable customisable coversheet.
- Track, resubmit, re-route or cancel messages. Messages can be retrieved historically, and the system audit trail queried on an individual or departmental basis.
- Set up automatic and forced approval systems, with the option to prevent designated approvers from approving their own messages. Reasons for rejecting a message can be created and appended.
- Faxes can be sent in a variety of formats, including TIF images or native file types.
- Based on .Net framework, and runs on Windows XP and Vista operating systems.
- Sits in the Windows system tray: users are notified on receipt of a new message and when final delivery has taken place.

With the PCC you can:

- Manage fax, SMS and email messages on an Individual or departmental basis.
- Set up personal or shared address books of fax numbers, email addresses and SMS numbers.
- Send faxes, SMS messages and emails to one or multiple recipients.
- Attach documents in native file formats for conversion to fax or to be sent in original form to email destinations.
- Specify billing codes for recharging and audit purposes.
- View and forward received faxes, and mark them to be actioned by a departmental user.
- Print sent and received faxes.
- Organise and manage faxes with real-time fax status and notifications; locate messages quickly through query builder; and access online archive store for document retrieval.
