

Lane Passport 4000 Multi- functional Peripherals

Full integration to achieve maximum benefits.

Multi-functional Peripherals (MFPs) have grown significantly in popularity over recent years. Combining printing, scanning, copying and fax in one machine, they offer ease of use, take up little space, and deliver a better return on investment than separate devices.

But all too often they operate as technology islands and, by leaving them separate from their wider communications network, many organisations are failing to maximise their use. Their isolation also makes it difficult to fulfil compliance requirements for regulations such as Sarbanes-Oxley.

Lane's Passport 4000 fax server solution enables MFPs to be integrated into your communications infrastructure. As a result, you can realise the full potential of these powerful and versatile devices:

- All incoming and outgoing messages are centrally archived, monitored and logged, ensuring traceability of all documents.
- Hardware and maintenance costs are reduced by driving more activity through your MFPs.
- Productivity, workflow and customer relations are improved by integrating with ERP, CRM and document management systems.
- Compliance requirements are met for both internal management and legal obligations.
- Enables the implementation of cost-effective fax-over-IP solutions.

Industry-leading partnerships

Lane has developed strategic alliances with key MFP manufacturers to provide approved software solutions which enable their products to be fully integrated into your broader communications network.

HP: Lane's Passport 4000 fax server software integrates seamlessly with HP's full range of MFPs, which offer the same advantages as its popular and award-winning LaserJet printers.

Xerox: Lane is a Xerox Business Partner and our Passport 4000 solution has been developed and tested in conjunction with Xerox. It integrates with Xerox's WorkCentre Pro and Document Centre MFPs, opening them up to using an MFP for faxing as well as for printing, scanning and copying.

Ricoh: Lane is a Premier Plus member of the Ricoh Develop Program (RiDP™) and provides interfaces which enable Ricoh products to integrate seamlessly into data networks.
