

6 WAYS FAXING CAN REDUCE COST

Whenever companies purchase tools, software, or work with a partner, cost is always a driving factor. Cost reduction is one of the most obvious benefits of implementing fax servers. These savings take many forms from hardware rationalization to infrastructure consolidation and lower call charges.

Communicate Seamlessly through Centralization

A centralized fax server can utilize its own least cost routing rules and the organization's network infrastructure to make use of low or zero rate call charges while still keeping full control over fax messages.

Follow Compliance Guidelines

Costly compliance problems are massively lowered by having a centralized audit and archive of all fax messages which will save you a massive amount of time in your daily workflow.

Consolidate Fax Functions

Much lower annual maintenance costs can be achieved by consolidating all fax functions into a single, robust fax server and retiring standalone fax machines.

01

Install a Fax Server

Most standalone fax machines are idle for the majority of the day, however, they not only use electricity, but they take up significant space in your office. By installing a fax server, you can eliminate this cost.

02

03

Consolidate Fax Lines

Consolidation of your fax operations into a single, robust fax server reduces the number of distributed fax lines required and improves lines that are actually in use.

04

05

Implement a Tracking System

Tracking inbound and outbound faxes and monitoring fax configuration anywhere on the network will become a simple task with a tracking system.
